TOTAL CROP LAND (1935 FEDERAL CENSUS)—ACRES HARVESTED, FAILURE, IDLE AND FALLOW IN 1934)

Each dot represents 5,000 acres

THE HOW, WHY, AND WHEN OF CROP AND LIVESTOCK REPORTS

(and Agricultural Statistics Generally)

HOW

Reports of the Colorado Cooperative Crop and Livestock Reporting Service make available to farmers and the public as a whole the up-to-date facts of Colorado agriculture. These facts, as near as it is humanly possible to determine them, are made quickly available. The program for crops includes forecasts of probable production several months in advance of harvest, a preliminary report at, or immediately following, harvest, and a final report toward the close of the calendar year. The procedure followed in making these forecasts and estimates is briefly: (1) Determination of the changes in acreage which have occurred; (2) Interpretation of condition of the growing crop in percentage of normal to a probable yield per acre. This interpretation is made through a study of the relationships which have maintained between condition of the growing crop and final yield per acre in previous years; (3) Estimated acreage multiplied by interpreted probable yield per acre gives indicated probable quantity production. In the field of livestock reporting, the size of the lamb crop is determined in July, fully two months before these animals begin to move to market in volume. Here again, the one, two, three procedure is followed: (1) An estimate of the number of ewes of breeding age; (2) Number of lambs docked or saved per hundred ewes; (3) Number of ewes of breeding age multiplied by number of lambs saved per 100 ewes gives the total number of lambs saved. The program of pig surveys, to put it humorously makes it possible to anticipate what mamma pigs have in mind in the way of changes in the size of the family several months in advance of the actual birthdays. This information, in turn, permits forecasting, with a serviceable degree of accuracy, the changes which will occur in hog marketings nearly one year in advance of actual marketing. Farm reports of "intentions to breed" form the basis for these forecasts. Actual estimates of the size of the pig crops are subsequently made, again using the one, two, three technique, but, in this case: (1) Is the estimated number of sows which gave birth to pigs during a specified period of time; (2) The average number of pigs saved per litter, and (3) Sows times pigs equals the total pig crop for the specified period. The seasonal changes in milk flow and egg production are determined around the calendar year, using the same one, two, three procedure.

The above illustrations merely highlight the methods used and describe the procedures in very simple terms. In actual practice, the procedure is not so simple, but varies greatly, and is frequently rather complicated, depending upon the problem involved and the result required. In other words, a true determination of the changes which have occurred depends on careful compilation and analysis of the "samples" which have been obtained through the corps of public-spirited farmer correspondents and other correspondents of the United States Agricultural Marketing Service and the Colorado State Planning Commission. These "sample data" are supplemented by information obtained through first-hand observation by the statisticians and other sources. Use of "sample data" to determine changes which have occurred, or are to occur, within an entire field of interest is not new nor is application of this procedure by any means confined to the crop and livestock reporting field of endeavor. To illustrate: if one interested in the physical characteristics of men in the United States wished to determine the average height of all men in the country, he would not need to measure the height of every man in the country. He would need only to measure the actual height of a representative group of these men. That is, tall men, short men, medium sized men, etc. Similarly, the Crop and Livestock Reporting Service does not need a report on the condition of crops growing on every field in the state. But, rather, it needs only the considered judgment of its selected group of crop correspondents. A forester who wishes to determine the number of board feet of lumber in a given tract of timber does not measure every tree in the tract, but makes sample measurements of a selected representative area. He is thereby enabled to determine with a serviceable degree of accuracy the number of board feet of lumber in the entire tract. Changes in crop acreages and changes in livestock numbers for the entire state of Colorado are similarly determined by obtaining through mailed schedules of inquiry a "sample" of the changes which are planned or have taken place on a representative group of farms. Use of this sampling technique has two outstanding advan-

WHY

Crop Reporting is Not New—The year 1938 marked the 75th anniversary of crop reporting in the United States. The program was inaugurated in 1863 under the direction of Isaac Newton, Commissioner of Agriculture in the Cabinet of President Abraham Lincoln. It was not as late as 1863, however, that a need for crop information in advance of harvest was recognized by the farmers of the country. In the year 1839, Mr. James T. Earle, then President of the Maryland Agricultural Society, complained that farmers were concerned about the profits that were being made by the dealers and speculators through the circulation of misleading reports on crop production. The subject of obtaining adequate and accurate information regarding crop conditions before the crops had gone to market was discussed. Later, Mr. Earle enlisted the aid of the presidents of agricultural societies in other states.

The occasion of the 75th anniversary of the inauguration of crop reporting was celebrated with an appropriate radio broadcast from Washington as a part of the National Farm and Home Hour in May, 1938. During this broadcast, the history of the development of crop reporting was briefly reviewed and honors done to crop correspondents past and present who gave, and are giving, unspareingly of their time without compensation to aid in making the facts of agriculture available. Particular tribute was paid to the families of those correspondents who had served in this capacity for several generations. One of Commissioner Newton's statements regarding the need for crop reports was read. This quotation is, in part, as follows: "Ignorance of the state of our crops invariably leads to speculation, in which oftentimes the farmer does not obtain just prices and by which the consumer is not benefited . . . the relations between agriculture, manufacturers, and commerce demand that something should be done to obtain, and publish, at brief intervals during the crop season, reliable information of the amount and condition of these crops . . . the connection between the industrial pursuits creates mutual interest. There is no clearer principle of political economy than this, that as the farmer is enriched all other classes prosper." Commissioner Newton's statement regarding the need for adequate information regarding crop conditions and production is just as true today as it was then. The crop reporting system which he began has developed through the years into an indispensable service. Yet, curiously enough, there are still a few farmers and people in other walks of life who sincerely believe that crop reporting is harmful and should be eliminated. Fortunately, these views are held by only a few.

Civilization and education represent an accumulation of human experience. Judgment regarding any matter is based upon analysis and conclusions drawn from the information available. Obviously, judgment can be no better than the information upon which it is based. It follows logically, therefore, that farmers and others concerned with the agricultural industry can come to better conclusions regarding production and marketing plans if they have accurate and adequate information. Industrial concerns and manufacturers spend large sums annually to determine the facts regarding their industries. It is equally important for the agricultural industry, in its many branches, to have adequate information as a basis for better judgment and better planning. The uses of crop and livestock information are legion. Some of these are set forth in outline form in the last 2 pages of this bulletin.

FLOYD K. REED,
Agricultural Statistician.

- October Preliminary estimate of spring wheat, oats, barley, tame hay, and peaches. Another forecast of probable production of corn, grain sorghums, potatoes, beans, etc., is made together with another forecast of probable production of apples, pears, and grapes. Condition of pasture. Farm grain stocks are again reported as of October 1, together with stocks of wheat in country mills and elevators as of October 1. Wages being paid to hired farm labor.
- November Preliminary estimate of corn, sorghums, sugar beets, potatoes, beans, apples, pears, and grapes. Condition of pasture.
- December Reports issued during this month represent the final estimates of crop production during the year. These are based on all evidence compiled throughout the growing season together with information made available through extensive fall surveys made subsequent to harvest. Revisions of all previous estimates which these fall surveys indicate to be necessary. These reports include a final estimate of planted and harvested acreage for each crop together with the final estimate of production. Average prices for the season are also established and the inventory value of each crop computed. A report is also issued in December giving the estimated acreage of winter wheat and rye sown for harvest in the year following. The condition of these two crops is reported as of December 1. Estimates of barley and rye stocks are also made as of December 1.

TRUCK CROPS—Commercial Vegetables

Crops Grown for Fresh Market

Truck crop reports include estimates of acreage at planting time together with forecasts of production throughout the growing season. Most of these reports are issued from June to November during the early part of each month. These reports giving basic information are supplemented with semi-monthly truck crop news reports which give verbal descriptions of the progress and development of truck crops in Colorado together with similar information for the same crops in states which market in competition with Colorado grown crops.

Crops Grown for Processing

The program for truck crops also includes estimates of acreage and forecasts of production for crops being grown for processing. These are also issued in season.

LIVESTOCK REPORTS*

- January Cattle and sheep and lambs on feed, January 1. Condition of ranges, cattle and sheep, January 1.
- February Number and value of each class of livestock (including chickens and turkeys) on farms, January 1. Intention to purchase or home-hatch turkey poult. Condition of ranges, cattle and sheep, February 1.
- March Final estimate of wool shorn during preceding year. Condition of ranges, cattle and sheep, March 1.
- April Cattle on feed. Condition of ranges, cattle and sheep, April 1.
- May Farm production from meat animals during preceding year. Condition of ranges, cattle and sheep, May 1.
- June Spring pig crop (sows farrowed, pigs saved) and forecast of number of sows bred and to be bred to farrow fall pigs. Condition of ranges, cattle and sheep, June 1.
- July Lamb crop. Condition of ranges, cattle and sheep, July 1. Turkeys being raised.
- August Cattle on feed, August 1. Wool shorn. Condition of ranges, cattle and sheep, August 1.
- September Turkeys raised and marketing plans. Condition of ranges, cattle and sheep, September 1.
- October Cattle and lamb feeding situation. Condition of ranges, cattle and sheep, October 1.
- November Cattle and lamb feeding situation. Condition of ranges, cattle and sheep, November 1.
- December Cattle and lamb feeding situation. Condition of ranges, cattle and sheep, December 1. Fall and total pig crop (sows farrowed and pigs saved) and forecast of number of sows bred and to be bred to farrow spring litters.

*Production of milk per cow and production of eggs per 100 hens is reported each month, but to avoid repetition has not been shown opposite each month in the chronology.

Oats and Barley—Oats production for 1939 was estimated at 4,205,000 bushels, the smallest crop since 1934, and compared with 5,053,000 bushels produced in 1938, and 4,504,000 bushels, the 10-year average. The barley crop totalled 7,566,000 bushels against 11,985,000 bushels, the relatively large crop of 1938, and 8,075,000 bushels, the 10-year average. The 1939 yield per acre of both of these crops was lower than 1938, but above average. A substantial portion of the acreage of each crop is irrigated, and irrigated yields were fair to good. Dryland yields were low due to grasshopper injury, lack of sufficient moisture, and high temperatures which resulted in premature ripening. The farm value of oats was \$1,514,000, compared with \$1,364,000 for the 1938 crop. The 1939 barley crop was valued at \$3,405,000 against \$3,596,000 for the much larger 1938 crop.

Sorghums—The quantity of **Grain Sorghums** harvested “for grain” in 1939 totalled 437,000 bushels, less than half the large 1938 crop of 1,008,000 bushels, but above the 10-year average of 370,000 bushels. Only 145,000 tons of grain sorghum forage were harvested, compared with 320,000 tons in 1938. Production of **Sweet Sorghum** forage totalled 173,000 tons against 285,000 tons in 1938, and 113,000 tons, the 10-year average. Due to unfavorable moisture conditions at planting time, slightly less sorghums were planted in 1939 than in 1938. About 795,000 acres were planted, but unfavorable summer weather resulted in large acreage of total failure, and only 484,000 acres of all sorghums were harvested. The crop is gaining favor because of its drouth resistant qualities and the influence of improved varieties. Value, all sorghums, 1939, \$2,311,000; 1938, \$2,687,000.

All Tame Hay—Shortage of moisture cut the all tame hay crop to 1,537,000 tons. With the exception of the very short 1934 crop of 1,257,000 tons, production in 1939 was the lowest since 1910. The 1938 crop totalled 1,892,000 tons, and the 10-year average 1,823,000 tons. This shortage of over 300,000 tons in the tame hay and a small wild hay crop were real handicaps to the Colorado livestock industry. The large carry-over of old hay and the mild, open winter helped to relieve the shortage resulting from small 1939 production. Hay prices were the highest since 1934, and the farm value of the 1939 all tame hay crop was \$13,987,000, compared with \$11,541,000 for the much larger 1938 crop. Pasture and range grass was very short all summer and fall. There was little grass on winter ranges.

Alfalfa—Production (included with all tame hay) totalled 1,186,000 tons, compared with 1,388,000 tons in 1938, and 1,337,000 tons, the 10-year average. Many fields produced just two cuttings, some only one.

Wild Hay—Production in 1939 was estimated at 275,000 tons, compared with 374,000 tons in 1938, and 329,000 tons, the 10-year average. Excepting the very short crop of 1934 of 216,000 tons, the 1939 crop was the smallest of record. Value of the 1939 crop, \$2,338,000; 1938 crop, \$2,244,000.

Broomcorn—The revised estimate of 1939 production is 4,600 tons, which was the largest crop produced in the state since 1932. Production in 1938 was 3,800 tons, and the 10-year average 5,570 tons. The crop in the United States was short and the price received per ton by Colorado growers for the 1939 brush was the highest in several years. The 1939 crop valued at \$446,000 was the largest cash return to growers since 1934. The 1938 crop was valued at \$171,000.

During the period 1927 to 1932, Colorado ranked high among the states as a producer of broomcorn. In 1930, the state produced 10,400 tons. Baca County, located in the far southeastern corner of the state, is the principal producer. Rainfall and growing conditions have been very unfavorable in that area in recent years, and broomcorn crops have been small. Most of the broomcorn grown in Colorado is of the “standard” variety. (Correction: The 1938 publication erroneously stated that most Colorado broomcorn was of the “dwarf” variety.)

Field Peas—Acreage in 1939 continued small, reflecting the down-trend in plantings which began in 1931. The area harvested in 1939, estimated at 18,000 acres, was less than one-half the 49,000 acres harvested in 1930. Production in 1939 was estimated at 198,000 bushels, the same as 1938 and compared with 388,000 bushels, the 10-year average. In a number of earlier years, production exceeded one-half million bushels. The San Luis Valley, located in south-central Colorado, produces most of the field peas in the state. A substantial portion of the acreage is grazed in the field by livestock. In recent years, not only has the total acreage declined but the proportion of the total acreage harvested for grain has also declined.

Grapes, Apricots, Plums—Grapes are grown primarily in Mesa, Delta, Fremont and Garfield Counties, and also in the area tributary to Denver. In 1939, 500 tons of grapes were harvested, compared with 650 tons in 1938, and 492 tons, the 10-year average. Plums are also grown in these counties, but on a relatively small scale. Apricots are grown in the same two counties which produce peaches on a commercial scale.

Strawberries, Raspberries—These two berry crops and other berries are grown primarily in Jefferson County and in other areas tributary to Denver. A portion of these fine quality berries is shipped to outside markets, but the bulk of them go to supply the Denver market. These small fruits are also produced in some volume in Larimer, Garfield, Fremont, Mesa, and Delta Counties.

TRUCK CROPS (Commercial Vegetables)

The commercial vegetable acreage harvested in 1939 totalled about 61,000 acres, continuing the uptrend which had been under way for several years. These vegetables were valued at \$6,754,000 compared with \$4,915,000 for such crops produced in 1938, and \$6,000,000, the 10-year (1928-37) average. These crops are grown almost entirely in the irrigated areas (see map inside back cover), although some crops such as lettuce and spinach are grown in the northwest and mountain areas without irrigation.

Colorado vegetables are known throughout the country for their quality and flavor. The commercial vegetable industry is an important one as related to the amount of labor employed, the gross value of crops produced and the high value per acre.

The rank of truck crops in relation to the acreage devoted to each of them is as follows: Green peas, cantaloupe and honey-dew melons, cabbage, tomatoes, lettuce, onions (dry), snap beans, cauliflower, spinach, celery, and carrots. Other vegetables, such as broccoli, egg plant, peppers, turnips, radishes, and green onions, and, in fact, practically all of the common garden vegetables, are grown somewhere in Colorado. The quantity of these vegetables in the second group is rather small and most of them are consumed locally, but parts of these crops reach markets outside the state through truck or express shipments.

Cantaloupes and Honey-Dew Melons—This crop is a very important one in the Arkansas Valley, where shipments supply a large percentage of the total consumption of the Nation during the months of August and September. "Rocky Ford" cantaloupes long have been known for their splendid flavor. Recently a large part of the acreage has been planted to "Resistant 45's" which permits vine ripening without reducing shipping quality. Many cars are now being "pre-cooled" before shipment and this, together with vine ripening, is placing Colorado cantaloupes on consumer tables with even better quality and flavor than formerly.

The proportion of honey-dew melons has increased greatly in recent years and a substantial percentage of these melons is also vine ripened and pre-cooled before shipment. In most years quality and flavor are excellent. Consumers may look forward to an even better product in the future. Colorado vine-ripened honey-dews are a real treat.

Counties which lead in production are Crowley, Otero, Pueblo, Bent, Adams, Weld, and Mesa.

Green Peas—This crop is grown to supply both the canning and fresh vegetable market. A goodly portion of the peas grown in northern Colorado, in the Canon City area, and in the San Luis Valley are canned each year, but the fresh crop from these areas is widely distributed. In 1939, 13,200 acres were grown for the fresh vegetable market, and 3,250 acres were grown for canning. The total crop was valued at \$988,000. Principal producing counties are Conejos, Costilla, and Custer, where the bulk of the crop is shipped fresh. Production in Boulder and Larimer Counties is largely canned.

Cabbage—Cabbage of the Early Domestic type supplies the summer market, beginning in July, while the Late Danish type supplies the fall and winter markets. The bulk of the crop is produced in Weld, Adams, and Costilla Counties. A small quantity is canned as kraut each year. The 1939 crop of all cabbage was valued at \$644,000, which was more than double the value of 1938 production, which was unusually low due to severe competition from eastern states. This resulted in poor demand for Colorado cabbage in the more distant markets and low prices being paid to Colorado producers. Only 4,560 acres of all cabbage were harvested compared with 5,480 acres in 1938. Quality and flavor of Colorado cabbage are excellent.

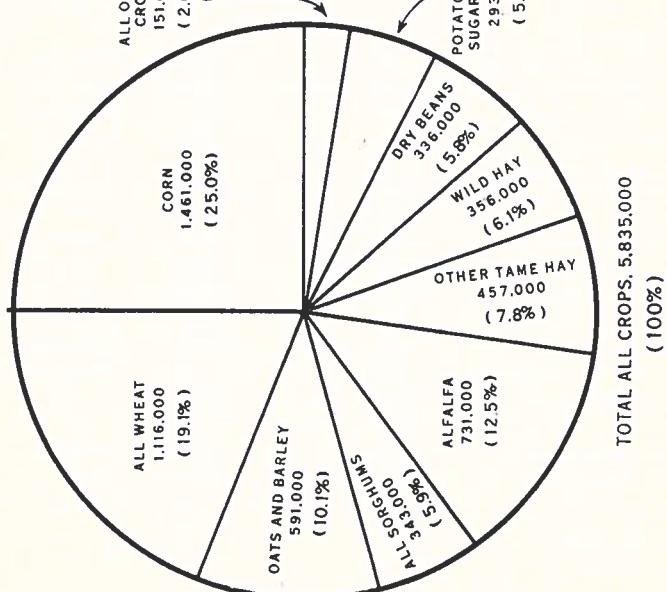

in that year or several years preceding. In 1929, nearly 7,400,000 acres of crops were planted or grown, of which 6,600,000 acres were harvested. In 1932, farmers endeavored to offset low prices by planting larger acreages of nearly all crops and thereby increase income. In that year, 8,500,000 acres were planted or grown (a record high acreage) but an unfavorable growing season resulted in failure of about four out of ten acres, and only 5,850,000 acres were harvested. Ever since this costly experience, the agricultural plant has been operated on a smaller scale. (Nearly all of this contraction occurred in the eastern plains section of the state.) In 1934, only a little over 7,100,000 acres of all crops were planted or grown, and in no year since that time has the total equalled 7 million acres. In 1938, only 6,760,000 acres of crops were planted or grown but the season was fairly favorable, and 5,941,000 acres of all crops were harvested. These totals in 1939 were 6,680,000 and 4,910,000 acres, respectively. Realizing the need for conservation of both soil and moisture, farmers in the non-irrigated sections of eastern Colorado began summer fallowing a larger percentage of their cropland. There has been a general trend toward increasing the number of acres per farm. As the smaller operators left, those remaining have leased or purchased the land and have added this acreage to their own units. More farmers now operate units of 1,000 acres or more than were operated in units of this size 5 years ago. This has made for more economical use of power machinery, and enhanced proper soil management. With this consolidation of units, increased use of power machinery, and less intensive use of crop acreage in eastern Colorado, it is obvious that farm population in these areas has declined. Some farm people who have moved from this non-irrigated area have left the state, others have moved to cities within the state, while still others have moved to irrigated farms within the state. Tracts have been taken over in the irrigated San Luis Valley and in the irrigated western valleys and on the mesas. During the last several years considerable non-irrigated land in southwestern Colorado has been cleared of sagebrush and other native vegetation and planted to pinto beans. This new land has provided homes for a considerable number of farm families who have moved from eastern Colorado and other states.

Acreage Trends—Since 1929 there has been a general down trend in the acreage of corn, oats, alfalfa, sugar beets, beans, wheat, and broomcorn in the state. There has been an up trend in the acreage of sorghums and barley, while the acreage of potatoes and wild hay has continued fairly steady. There has been a pronounced down trend in the production of apples and pears and an equally pronounced up trend in the production of peaches. The down trend in acreage of corn has resulted to a considerable extent from the substitution of both grain and sweet sorghums. Sorghums have increased in favor in recent years. The drought-resistant qualities of these plants and the introduction by the state experiment stations of better adapted and improved varieties of grain sorghum have given these crops an advantage over corn. The stability of the livestock industry in eastern Colorado is largely dependent upon production of an abundant supply of feed in favorable years. Sorghums are aiding greatly in meeting this requirement of the livestock industry. Although there has been a general down trend in the total acreage of corn, the acreage grown under irrigation has increased since 1929, and much of this increase has taken place in the last few years. The down trend in the acreage of oats has occurred wholly in the non-irrigated sections. The acreage grown under irrigation has increased. The down trend in the acreage of sugar beets has been pronounced. The largest acreage ever grown in Colorado, 242,000 acres, was harvested in 1930. The acreage declined gradually until 1938 when only 137,000 acres were harvested. In 1939, 145,000 acres were harvested. Failure of the crop to show profits commensurate with the difficulty and expense involved in growing the crop has caused many farmers to grow smaller acreages and others to substitute other crops. For many years, Colorado ranked first among the states in the production of sugar beets and beet sugar. California ranked first in 1938 and 1939.

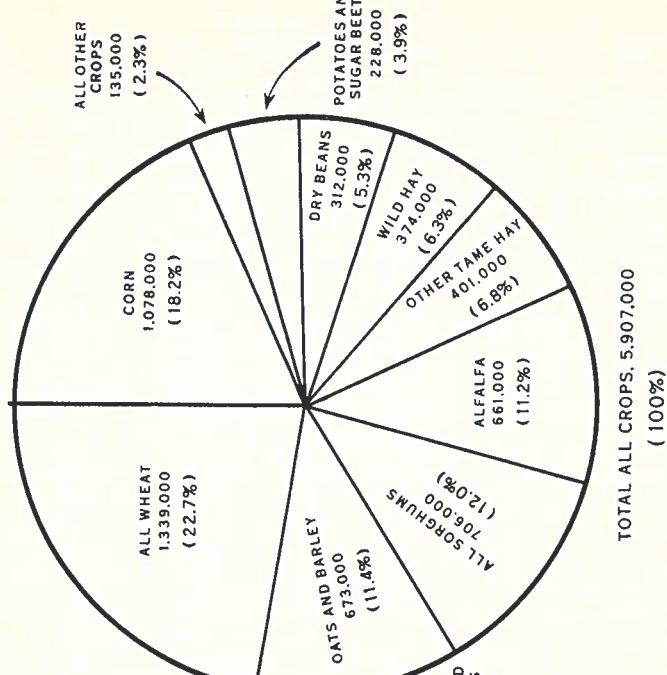

The alfalfa acreage has declined almost steadily for over 15 years. General prevalence of bacterial wilt has necessitated replanting every three to five years if stands yielding a satisfactory tonnage were to be maintained. This has increased the expense of growing the crop. Growing of alfalfa is closely correlated with the general welfare of the livestock feeding and dairy industries in the irrigated sections of the state and it is hoped that, as wilt-resistant varieties become available from the increase plats of plant breeders, this down trend will be overcome and reversed. In 1924, Colorado had 890,000 acres of alfalfa. By 1930, this acreage had declined to 826,000 acres and in 1937 only 636,000 acres were harvested. The acreage was increased to 661,000 acres in 1938 but declined again in 1939.

1,240,000 head docked in 1938 and 1,270,000 head, the previous record crop of 1934. The large 1939 lamb crop resulted principally from a high lambing percentage but the ewe inventory was also large. In 1939, 92 lambs were saved or docked for every 100 ewes one year old and over on hand at the beginning of the year. This was the highest lambing percentage ever realized. Weather during the period when most of the lambs were dropped was mild and mostly free from bad storms and death losses at lambing were few. Colorado lamb crops during each of the years 1934 to 1938, with the exception of 1935, totalled approximately one and one-quarter million head.

Wool—The wool clip of 1939 totalled 13,244,000 pounds compared with 12,862,000 pounds in 1938 and was one of the largest quantities ever shorn in the state. In only five years prior to 1939 had Colorado sheepmen taken over 13 million pounds of wool from the backs of their flocks. The record clip of 13,541,000 pounds was shorn in 1931. The 1939 wool clip was valued at \$2,914,000 compared with \$2,315,000 for the 1938 clip. (See index for reference to table on wool production and value.)

Calf Crop—The number of calves born in both beef and dairy herds totalled 555,000 head in 1939 compared with 536,000 head in 1938. In most years the number of calves born on Colorado farms and ranches exceed one-half million head, but in only two years since 1924 has the number exceeded 600,000 head.

Pig Crop—Hog production was expanded extensively in 1939. More farmers raised hogs, and established hog producers increased the size of their herds. The combined spring and fall pig crops of 1939 totalled 505,000 head. This was an increase of nearly two-thirds from the 317,000 pig crop of 1938, and was the largest annual total since 1933. Unfortunately, this expansion occurred during a period when the large hog-producing sections of the United States had also increased production, and coincided with a year in which feed grain production in Colorado was low. This resulted in an unfavorable feeding relationship between hog prices and feed prices and many of these pigs were fattened on low profit margins or actual financial losses. Colorado, however, is rather favorably located as related to market outlets for hogs. In addition to the local demand and the demand of the Denver Stockyards market, hogs can be shipped to the Pacific Coast at a good price advantage compared with competing areas to the east. Frequently, in recent years prices on the Denver market have equalled or exceeded prices paid at Omaha, Kansas City, or other Missouri River markets.

Chickens and Eggs—The number of chickens produced on Colorado farms in 1939 was estimated at 6,572,000 birds, of which 3,969,000 were sold from farms during the year, and 2,344,000 were consumed in farm households. The remaining birds were added to the flock inventory. Egg production in 1939 was estimated at 361 million, of which 267 million were sold and 89 million were consumed in farm households. Chickens and eggs produced in 1939 were valued at \$7,608,000 compared with \$8,179,000 for 1938 production. It is obvious from the size of these figures that the chicken industry in Colorado is a desirable complement to the farm enterprise as related to the farm family living and as a provider of ready cash.

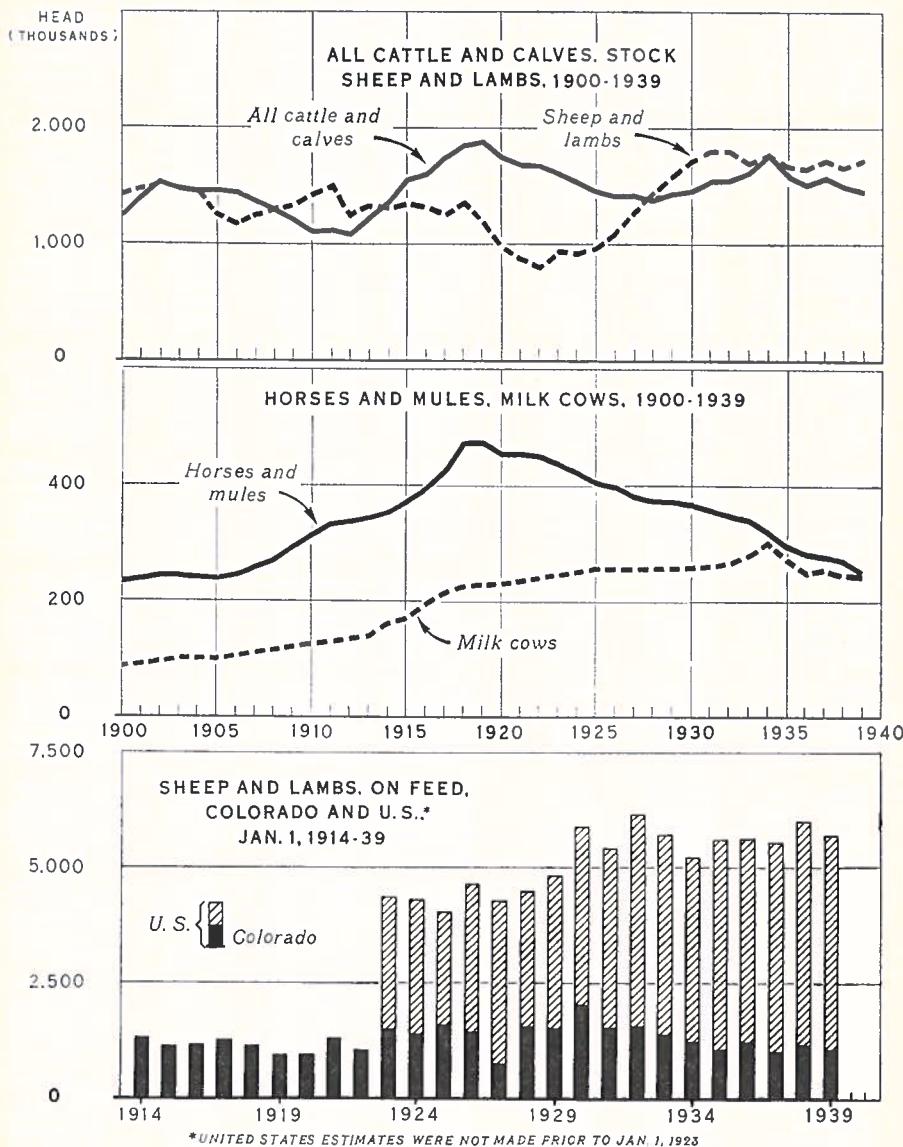

Colorado leads the states in the Rocky Mountain Region in the production of chickens and eggs. Of the eleven states located west of the one hundred second meridian, only California and Washington exceed Colorado in production. A large percentage of the chickens and eggs produced in Colorado are produced from flocks of less than 400 hens and pullets, which are a complement to general farm operations. There are, however, approximately 200 commercial flocks in the state having in excess of 1,000 birds each.

Turkeys Raised—The number of turkeys raised annually usually totals between 500,000 and 600,000 birds. The 1939 turkey crop, conservatively estimated at 693,000 birds, was the largest ever grown and finished for a market in the state and compared with 513,000 raised in 1938. The turkeys raised in 1939 returned \$1,538,000 to the experienced growers of the state. The 1938 crop returned \$1,272,000.

A large percentage of Colorado turkeys are of good quality and are marketed as dressed birds. Climate is favorable for the turkey industry. Turkeys are raised in nearly all counties in the state, but are grown commercially primarily in Larimer, Weld, Jefferson, Morgan, Adams, Washington, and Yuma Counties of northern Colorado and in Otero and Prowers Counties in the southeast. Turkeys are also raised commercially on the Western Slope, where Delta, Montrose, and La Plata Counties lead.

Livestock Feeding—Colorado leads the country as a producer of grain-finished lambs, and during the period 1923 to 1932 fattened annually 25 to 35 per cent of the total of the nation. In recent years, the number has declined to around 20 per cent. The northern Colorado section is advantageously located

GRAINS—COMPARISON OF IRRIGATED AND NON-IRRIGATED YIELDS PER ACRE
HARVESTED, 10 YEAR AVERAGE, 1928-1937

U. S. DEPARTMENT OF AGRICULTURE

NEG. 54.

AGRICULTURAL MARKETING SERVICE

IRRIGATION IN COLORADO

Colorado ranks second among the states in the country in number of acres under irrigation. With approximately 3,400,000 acres irrigated, Colorado is exceeded only by California. The effect of irrigation upon crop yields in the state is well illustrated by the chart on this page. This reveals for the crops shown, that irrigated yields per acre are approximately three times those obtained without irrigation. Although soil, the amount of natural moisture, the section of the state in which the crops are grown, and other factors affect yields, the supplying of sufficient moisture is the principal factor which determines yield per acre. Irrigation eliminates much of the hazard which attends crop production in the semi-arid portions of the United States. The average yield per acre of corn grown under irrigation in Colorado during the ten years 1928 to 1937 ranged between 25 and 40 bushels per acre (1934 excepted) and averaged 29.0 bushels. Winter wheat yields ranged between 22 and 34 bushels and averaged 26.6 bushels per acre. Spring wheat had a range of from 22 to 30 bushels with an average of 24.0 bushels. Oats ranged between 36 and 42 bushels per acre and averaged 38.4 bushels. Barley yields ranged between 31 and 39 bushels per acre and averaged 34.1 bushels. These figures are averages for the state as a whole. Many individual farmers obtained yields of each of these crops much in excess of these averages. During the same ten-year period quoted above the highest average yields obtained for any of these crops grown without irrigation was 21 bushels per acre. Both corn and oats made this average in 1930.

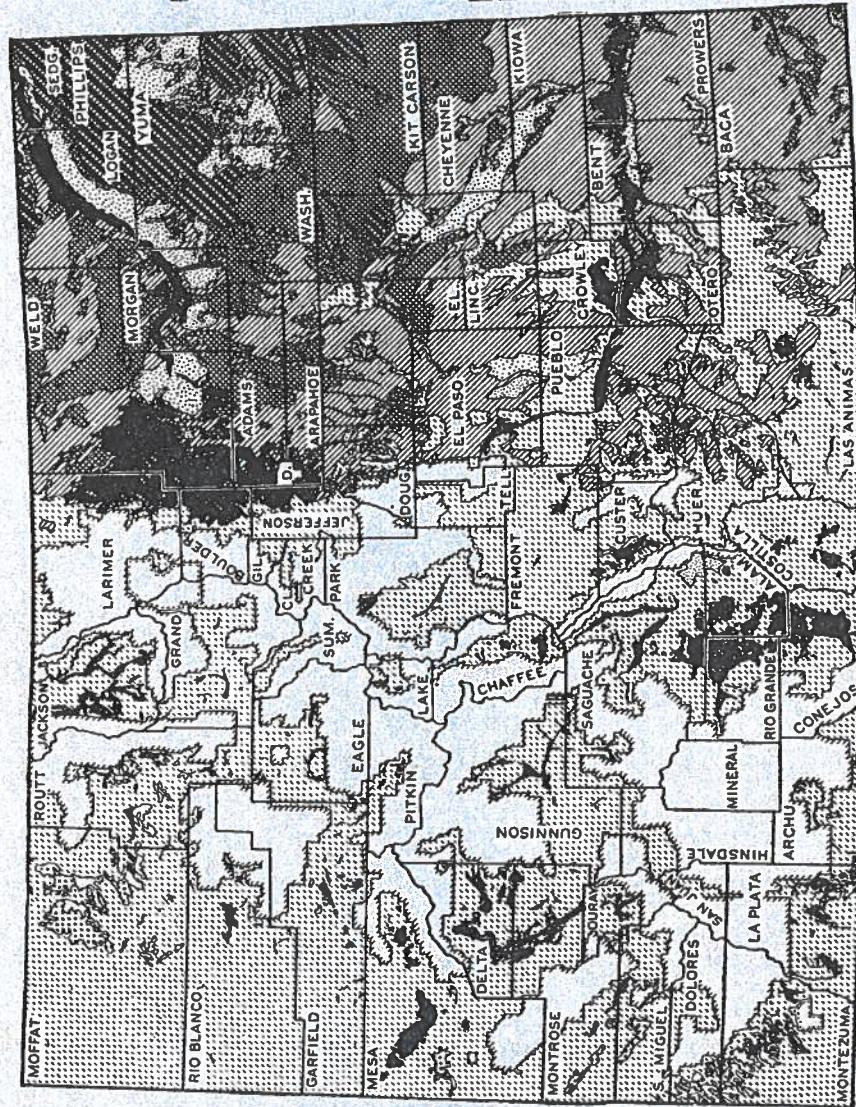

Good yields are obtained from dry edible beans grown under irrigation. During the ten years 1928 to 1937 bean yields ranged between 700 and 1,080 pounds per acre and averaged 777 pounds per acre. Potatoes respond well to irrigation and yields usually average above 150 bushels per acre. In 1930 the state average was 200 bushels per acre. Sugar beets also thrive in Colorado climate and the many days of fall sunshine provide relatively high sugar content. Average yields range between 11.3 and 13.7 tons per acre and usually exceed 12.5 tons and are among the highest obtained in the United States.

Over 90 per cent of the Colorado alfalfa acreage is grown under irrigation and yields averaged 1.9 tons per acre during the ten years, 1928 to 1937. A large percentage of the wild hay acreage is irrigated and yields usually exceed one ton per acre.

In recent years there has been an up trend in the irrigated acreage of corn, beans, wheat, oats and barley. The trend of the irrigated acreage of sugar beets and alfalfa has been down.

- (8) State Marketing Organizations:
 - (a) First essential for all marketing programs.
- (9) Schools:
 - (a) Agricultural statistics are more and more being used as a basis for the teaching of agriculture in schools and colleges. Many schools in Colorado are using this material for teaching agriculture and geography.
- (10) Bankers and Financiers:
 - (a) Basis for providing credit for production, storage, and marketing of crops.
- (11) Railroads:
 - (a) Enable economical distribution of cars for moving crops and livestock.
- (12) Insurance Companies:
 - (a) Basis for crop insurance and for placing farm loans.
- (13) Manufacturers:
 - (a) Guide for determining quantities to be manufactured.
 - (b) Best basis for distribution of manufactured products used in agriculture.
 - (c) Guide to locating manufacturing plants and locating supplies of agricultural commodities.
- (14) Advertising Agencies:
 - (a) Enable the placing of advertising to the best advantage.
- (15) Meat Packers:
 - (a) Reduce the uncertainty of supply, reflect future price trend, and reduce the necessary handling margin and enable the payment of maximum price which might not be given otherwise.
- (16) Chamber of Commerce:
 - (a) Provide facts for advertising local advantages.
- (17) Prospective Investors, Settlers and Buyers of Land:
 - (a) Best guide to relative agricultural resources and advantages of states and localities.
- (18) Legislators:
 - (a) Authoritative agricultural records needed as the basis for wise and constructive farm legislation.
- (19) Economists and Business Analysts:
 - (a) Essential for analyzing agricultural and business conditions.
- (20) Business Men:
 - (a) Valuable guide for determining when to expand or contract business operations.
- (21) Farm Papers:
 - (a) Basis of editorial judgment regarding agricultural conditions and the type of information likely to be most helpful to farmers.
- (22) National and State Government:
 - (a) Basis for many activities of the Department of Agriculture.
 - (b) Indispensable in the time of war and business crises, and necessary in enacting much of the farm legislation.
- (23) General Public Welfare:
 - (a) Nearly all business is inter-dependent. That is, the prosperity and development of one business depends greatly on the prosperity and development of all other business. Crop reports furnish an indispensable link between agriculture and other lines of business, and their scope and use has been expanded immensely in the disturbed period of years since the World War.
- (24) Consumers:
 - (a) Consumers of farm products benefit by full knowledge of supplies so that they can use more of things which are most abundant.
